

Homework 2.6 – Integrals of Linear and Quadratic Functions

1. (1 pt) [alfredLibrary/AUCI/chapter2/lesson6/question21pet.pg](#)

Evaluate the following indefinite integrals:

(a) $\int (-1t + 5) dt = \underline{\hspace{2cm}}$

(b) $\int (5t^2 + 6t + 8) dt = \underline{\hspace{2cm}}$

2. (1 pt) [alfredLibrary/AUCI/chapter2/lesson6/question31pet.pg](#)

Evaluate the following definite integrals using the Fundamental Theorem of Calculus:

(a) $\int_{-9}^{-8} (6u - 4) du = \underline{\hspace{2cm}} \Big| \underline{\hspace{2cm}} = \underline{\hspace{2cm}}$

(b) $\int_{-2}^4 (-4u + 8) du = \underline{\hspace{2cm}} \Big| \underline{\hspace{2cm}} = \underline{\hspace{2cm}}$

3. (1 pt) [alfredLibrary/AUCI/chapter2/lesson6/defintegralofflinear4p.pg](#)

A population of cattle is increasing at a rate of $P'(t) = 600 + 70t$ cows per year, where t is measured in years. By how much does the population increase between the 5th and the 8th years?

Total Increase = $\underline{\hspace{2cm}}$ cows

4. (3 pts) [alfredLibrary/AUCI/chapter2/lesson6/rectilinear-motion1pet.p](#)

All of your answers require units.

A stone is thrown straight up from the edge of a roof, 175 feet above the ground, at a speed of 16 feet per second. Recall that the acceleration due to gravity is -32 feet per second squared.

(a) Find the equation for the object's velocity using the relationship $v = \int -32dt$, remembering that the initial velocity is 16 feet per second. $\underline{\hspace{2cm}}$

(b) Find the equation for the object's position above the ground using the relationship $s = \int vdt$, remembering that the initial position is 175 feet. $\underline{\hspace{2cm}}$

(c) How high is the stone after 2 seconds? $\underline{\hspace{2cm}}$

(d) What is the velocity of the stone after 2 seconds?
 $\underline{\hspace{2cm}}$

(e) At what time does the stone hit the ground? (i.e., when is its position zero?) $\underline{\hspace{2cm}}$

(f) What is the velocity of the stone when it hits the ground?
 $\underline{\hspace{2cm}}$

(g) The net change in the stone's position from time 0 to time 2 is

$$s(\underline{\hspace{1cm}}) - s(\underline{\hspace{1cm}})$$

$$= \underline{\hspace{1cm}} \int \underline{\hspace{1cm}} \underline{\hspace{1cm}} dt$$

$$= \underline{\hspace{1cm}} \Big| \underline{\hspace{1cm}}$$

$$= \underline{\hspace{2cm}}$$

5. (1 pt) [alfredLibrary/AUCI/chapter2/lesson6/riemannunits1pet.pg](#)

The function $W'(t) = 20t^3 \frac{L}{hr}$ measures the rate at which water is flowing through a pipe at time t hr. Although we have not proved it yet, the Fundamental Theorem works for quadratic and cubic functions. That is, the net amount of water that has flowed through the pipe from $t = 2.5$ hr to $t = 6.1$ hr is given by

$$W(\underline{\hspace{1cm}}) - W(\underline{\hspace{1cm}}) = \underline{\hspace{1cm}} \int \underline{\hspace{1cm}} (\underline{\hspace{1cm}}) dt$$

Since we do not yet know an antiderivative W of the cubic function W' , we will estimate the integral using left-hand and right-hand approximations. Divide the interval $[2.5, 6.1]$ into 4 subintervals of equal width $\Delta t = \underline{\hspace{1cm}}$.

The left-hand approximation is given by

$$L_4 = \left(\begin{array}{l} \underline{\hspace{1cm}} + \\ \underline{\hspace{1cm}} + \\ \underline{\hspace{1cm}} + \\ \underline{\hspace{1cm}} \end{array} \right) \cdot \underline{\hspace{1cm}} =$$

(Include units in your final answer.)

The right-hand approximation is given by

$$R_4 = \left(\begin{array}{l} \underline{\hspace{1cm}} + \\ \underline{\hspace{1cm}} + \\ \underline{\hspace{1cm}} + \\ \underline{\hspace{1cm}} \end{array} \right) \cdot \underline{\hspace{1cm}} =$$

(Include units in your final answer.)

By the way, the exact answer is 6727.61 L. How close are the left- and right-hand approximations to the exact answer?
