

## Homework 5.2 – Derivative and Antiderivative of $e^x$

1. (1 pt) [alfredLibrary/AUCI/chapter5/lesson2/question30pet.pg](#)  
If  $h(x) = e^{4x}(4 + 2x^5 + 10x^8)$ , then  $h(x) = f(x)g(x)$ , where

$f(x) = \underline{\hspace{2cm}}$  and  $g(x) = \underline{\hspace{2cm}}$ .

By the product rule,

$h'(x) = \underline{\hspace{2cm}} * \underline{\hspace{2cm}} + \underline{\hspace{2cm}} * \underline{\hspace{2cm}}$

2. (1 pt) [alfredLibrary/AUCI/chapter5/lesson2/quiz/application2pet.pg](#)  
The vertical position from equilibrium (in meters) of a hydraulic piston  $t$  seconds after a downward force is applied and released is given by the function  $D(t) = -2te^{-5t}$ .

(a) Find the time at which the piston is at its furthest from equilibrium. That is, find the time at which  $D$  has a maximum or minimum.

$t = \underline{\hspace{2cm}}$  seconds

(b) Find the position at that time you found in part (a).

$D = \underline{\hspace{2cm}}$  meters

3. (1 pt) [alfredLibrary/AUCI/chapter5/lesson2/criticalinflectionpoint1pet.pg](#)  
Let  $f(x) = \frac{4e^x}{4+e^x}$ . If necessary, enter INF for  $\infty$ , -INF for  $-\infty$ , or NONE.

(a)  $f'(x) = \underline{\hspace{2cm}}$

(b) The open interval of increase for  $f(x)$  is  $\underline{\hspace{2cm}}$ .

(c) The open interval of decrease for  $f(x)$  is  $\underline{\hspace{2cm}}$ .

(d)  $f(x)$  has a local minimum at  $\underline{\hspace{2cm}}$ .

(e)  $f(x)$  has a local maximum at  $\underline{\hspace{2cm}}$ .

(f)  $f(x)$  has horizontal asymptotes at  $y = \underline{\hspace{2cm}}$ .  
(HINT: Set up the limits at  $\infty$  and  $-\infty$ . Notice that one limit can be evaluated directly, and the other is well-suited for L'Hopital's rule.)

4. (1 pt) [alfredLibrary/AUCI/chapter5/lesson2/limit1pet.pg](#)

Determine if the function  $y = \frac{8}{e^x - 1}$  has any horizontal asymptotes by evaluating the following limits. If necessary, enter 'INF' for  $\infty$  and '-INF' for  $-\infty$ . (HINT: Note that l'Hopital's rule does not apply to either limit. You must first determine the limit of the exponential term in the denominator.)

(a)  $\lim_{x \rightarrow \infty} \frac{8}{e^x - 1} = \underline{\hspace{2cm}}$

Enter the right-hand asymptote, or enter NONE:  $y = \underline{\hspace{2cm}}$

(b)  $\lim_{x \rightarrow -\infty} \frac{8}{e^x - 1} = \underline{\hspace{2cm}}$

Enter the left-hand asymptote, or enter NONE:  $y = \underline{\hspace{2cm}}$

(Click on graph to enlarge)

The graph of the function  $f(x) = 9x - e^x$  is the thick blue curve shown above. Assuming that the Fundamental Theorem of Calculus holds for exponential functions, use it to find the shaded area.

$\int_{-5}^3 \underline{\hspace{2cm}} dx = \underline{\hspace{2cm}} \Big|_{-5}^3 = \underline{\hspace{2cm}}$
